

Anchor - Architecture and Data Flow

Anchor is a native macOS application. There is no developer-operated server, database, or analytics service. All class data stays on the teacher's Mac.

TEACHER'S MAC

SIGN-IN FLOW

1. Teacher clicks Connect Zoom in the app.
2. Browser opens Zoom OAuth (authorization code + PKCE).
3. Zoom redirects to the static bounce page over HTTPS.
4. The page forwards only code and state to 127.0.0.1:51789 on the same Mac.
5. The app exchanges the code for tokens and stores them in the Keychain.

WHAT LEAVES THE MACHINE

Requests to Zoom and, optionally, Google Classroom - nothing else. No student data, engagement data, or captions are transmitted to the developer or to any third party. No hosted AI or language-model provider is used.
